

# ACM NDC Study:

## The 2015 Survey of Non-Doctoral Granting Departments in Computing

By: Jodi Tims, Stuart Zweben, Yan Timanovsky, Jane Chu Prey

In the winter/spring of 2015, ACM conducted the third annual ACM-NDC Study (a survey of “Non-Doctoral-Granting Departments in Computing”), intended to be an annual complement to the Computing Research Association (CRA) Taulbee Survey of Ph.D.-granting departments in computing [5]. ACM-NDC is funded by ACM (with generous support in the past from Google), and continues to be conducted with support from the CRA, AIS [1], and ACM SIGITE [2]. The survey comprises recent degrees, enrollments, faculty demographics and faculty salaries and includes gender and ethnic diversity characteristics of the faculty and of the students in the computing programs. The NDC Steering Committee comprises the authors of this article. As an annual study, NDC helps fill in gaps in data on non-Taulbee programs to present a more complete view of the academic landscape in computing and expand pipeline information on programs that produce candidates for Ph.D. programs as well as the private and public labor markets. The timely reporting of the survey’s results provides the community with an early look at workforce-related facts and trends of importance to academic programs and those who rely on them. This article reports the results of the NDC survey, with comparisons and contrasts to data reported in the Taulbee Survey and, as appropriate, last year’s NDC survey results.

The goals of ACM-NDC are to document trends in student enrollment, degree production, faculty demographics and salaries at not-for-profit U.S. academic institutions that grant bachelor's and/or master's degrees (but not doctoral degrees) in the five major computing disciplines: computer science (CS), computer engineering (CE), information systems (IS), information technology (IT), and software engineering (SE). Diversity statistics and trends with respect to students and faculty are important features of this documentation.

The survey was distributed in February 2015 to qualifying programs identified through data in the Integrated Post-secondary Education Data System (IPEDS) [3]. This data are collected annually by the National Center for Education Statistics (NCES) from all U.S. institutions that participate in the federal financial aid programs [5]. This year the survey was distributed to 1063 academic units (departments, schools, or institutions) identified via IPEDS as offering at least one program in computing. In some cases, a single institution received multiple surveys if programs are housed in different schools or departments. Responses were received for 158 academic units (compared to 156 in 2013-14) and data were reported for 291 total programs (248 Bachelor's and 43 Master's), compared to 364 the previous year. We found that 140 out of the 158 responding academic units provided data on faculty (150 in 2013-14) and 92 provided faculty salary information (135 in 2013-14).

Although there was some drop-off in overall programs represented as well as faculty salary data, we remain optimistic that overall NDC awareness continues to grow. Much of our work in this latest wave was focused on migrating to a more robust and sustainable data collection platform, which offers a better user-experience as well as enhancements in benchmarking [4]. This delayed the start of the data collection process and compressed the amount of time respondents had to provide their data. It may also be worth noting that there was a marked increase in response from 2012-13 to 2013-14, and in 2014-15 we were able to sustain this level of participation at the academic unit level. The NDC committee is cognizant of some common challenges in requesting data from NDC institutions, such as pulling together requested information from multiple administrators, respondent bandwidth issues, and collecting salary data from smaller departments and private institutions. Some of these will be addressed in the fourth wave of NDC (2015-16) including moving up the annual launch from winter to fall. Moreover, as we learn more about the various "residents" of our NDC community and continue our ongoing efforts to build awareness and expectations, and to reduce the user burden of this demanding survey, we expect the response rate to grow.

The following is a preliminary summary of some key NDC findings. Since this is only the third year of NDC, data were used primarily for comparisons with Taulbee while longitudinal trend analysis is still premature. Furthermore, small response sizes in some parts of the survey make it difficult to draw hard conclusions from the data provided. In reading this report, one should consider the following points.

- ▶ In this report, we will use the term "academic unit" (or unit) for the administrative division responsible for one or more qualifying programs. We will use the term "program" to refer to a course of study leading to a degree in one of the computing disciplines: computer science (CS), computer engineering (CE), information systems (IS), information technology (IT), or software engineering (SE).
- ▶ A given academic unit may offer multiple programs.
- ▶ Degree production (master's and bachelor's) refers to the previous academic year (2013-14).
- ▶ Data for current faculty as well as new students in all categories refer to the current academic year (2014-15) for which the survey is given.
- ▶ Total enrollment (master's and bachelor's) data are reported for both 2013-14 and 2014-15. However, it should be noted that due to platform changes, 2014-15 enrollment data come from academic units responding in 2014-15, while 2013-14 numbers come from last year's group of respondents.

## BACHELOR'S DEGREE PRODUCTION AND ENROLLMENTS

As shown in Table B1A, the number of academic units responding to the bachelor's portion of the survey remained steady in comparison to last year (158 vs. 156). There was a lower percentage of public (38.0% vs. 43.1%) and master's granting (26.6% vs. 34.4%) institutions than in 2014 (Table B1B). The total number of degree programs offered by the responding units is 248, much lower than the 302 programs that were represented in the 2013-2014 survey. Table B2 presents a breakdown of programs by discipline and institution type. A higher percentage of programs identify as

being CS than last year (64.9% vs. 56.6%) while the percentages of all other types of programs were lower. Of most significant difference were the percentages in CE (2.8% vs. 4.0%) and IT (10.1% vs. 14.6%). The disparity in number and types of programs from last year's survey necessitates that caution be used in drawing too many conclusions when comparing the results of the two surveys. In several tables, data from departments that responded in both years are presented and may be more representative of developing trends.

Also reported in Table B2 is the percentage of programs in each discipline and institution type that are ABET accredited. Computer engineering programs continue to report very high levels of accreditation (85.7%) and programs offered by master's granting institutions are more likely to be accredited than in non-master's granting institutions. Computer science programs are accredited more frequently at public institutions than private (41.7% vs. 10.9%), while IS programs are accredited at a much higher percentage of private institutions than public (17.2% vs. 7.1%) among this year's respondents.

Table B3A shows actual degree production in 2013-2014 and anticipated change in that production for 2014-2015 broken down by institution type. Anticipated increases of 21.7% and 15.9% in computer science and for all disciplines are lower than

those data reported at Taulbee institutions (23.0% and 19.0%, respectively). Increases are anticipated to be higher at master's granting institutions both for computer science and over all discipline types. Anticipated increases were similar in public vs. private institutions.

For departments that responded both last year and this year, Table B3B includes actual degree production for 2012-2013 and 2013-2014 as well as anticipated production in 2014-2015, again broken down by institution type. Aggregate actual degree production over all disciplines by consecutive-year respondents increased at a greater rate than was reported by last year's consecutive-year respondents (16.3% vs. 11.4%) and at a greater rate than reported by Taulbee school consecutive-year respondents (12.1%). In CS, actual degree production increased, but at a lower rate than reported last year (11.8% vs. 12.7%) and at a lower rate than reported by Taulbee institutions (13.6%). Degree production in 2014-2015 is anticipated to have a double-digit percent increase in CS (16.4%) and over all disciplines (13.2%), with private institutions anticipating the largest increases (23.9% in CS and 21.5% over all disciplines).

Reported degree production and anticipated change appear by discipline in Table B4. For those departments responding in both 2014 and 2015, actual degree production increased in all

disciplines except software engineering where a slight decrease was reported (-3.3%). The same departments anticipate increases in degree production in computer science, information technology and software engineering in 2014-2015 while expecting computer engineering to remain flat and information systems to decline slightly. Over all respondents, anticipated degree increases are very high in CS (21.7%) and software engineering (42.9%), and more modest in computer engineering (3.7%) and information technology (8.7%), while a decline in degrees is anticipated in information systems (-8.9%).

For the third year running, there was a higher percentage of females receiving degrees at NDC schools than was reported for Taulbee institutions (Table B5). The difference of 3.2% is similar to that reported in our 2013 report (2.9%) and higher than that reported last year (1.4%). Also of interest is that 17.9% is the highest rate of female degree recipients seen in the three-year

history of NDC. Software engineering reports the lowest percentage of female degree recipients (4.4%). The percentage of females receiving degrees was much higher in private vs. public institutions in computer science, computer engineering, and information systems. Non-master's granting institutions report higher percentages of females than master's granting institutions in all disciplines except software engineering.

For the third year in a row, NDC schools report higher percentages than Taulbee institutions of Black/African-American (8.3% vs. 4.1%), and White (67.2% vs. 56.7%) students (Table B6). Percentages of Asian and Non-Resident students at NDC schools are much lower than those percentages reported in the Taulbee survey (12.1% vs. 20.8% and 4.7% vs. 8.3%, respectively).

Enrollment increases among departments responding in both 2013-2014 and 2014-2015 are in the double digits at all institution types (Table B7). These increases are much more

pronounced than reported for the corresponding respondent group last year for private institutions (12.2% vs. 8.2%) and non-master's granting institutions (11.2% vs. 5.0%) and may indicate that the enrollment boom experienced by other types of institutions has now arrived at these schools as well. Enrollment changes in the all respondents group paint a more variable picture of enrollment trends but, as pointed out above, should not be given much weight due to the very different makeup of the all respondents group in comparison to last year. The mean enrollment per CS department in 2013-2014 at NDC schools continued to remain small in comparison to the Taulbee institutions (109.1 vs. 501.9).

Table B8 presents the change in mean bachelor's and new major enrollment for the last year and breaks those statistics out by discipline. We will focus our discussion on those departments responding both years as they provide more reliable and interesting information. The mean enrollment per

program increased in computer science (13.6%) and software engineering (11.7%), while declining the most in information systems (-10.5%). The mean number of new majors rose in computer science (4.1%) and information technology (1.2%), while declining the most in computer engineering (-33.3%). Also of note is that there has been a drop in the number of programs among these respondents, with two fewer computer science programs and one less information technology program among the group.

The percentage of new majors within the total enrollment of all responding programs appears in Table B9. Overall, 30.0% of enrollment is comprised of new majors, which is virtually unchanged from last year. The percentages in information systems and information technology are much higher than either of the two previous years (approximately 15% and 6%, respectively), while computer science and software engineering have remained steady.

## MASTER'S DEGREE PRODUCTION AND ENROLLMENTS

In 2014-15, 33 distinct academic units reported on a total of 43 master's programs in computing, down from last year's 51 units and 62 programs, respectively. Of the 33, 24 were public and 9 private (Tables M1-M2). They accounted for 27 programs in computer science, two in computer engineering, four in information systems, and five each in information technology and software engineering. The small number of participating academic units, students and programs, especially when considered on a discipline-specific basis, should be taken into account when drawing any conclusions from the data presented here. Furthermore, the low sample of units that provided master's degree data to the survey this year and last (15 units reporting on 21 programs in 2014-15, across all of the disciplines) precludes our drawing broad conclusions across multiple years.

Table M3 shows actual degree production in 2013-2014 and anticipated change in that production for 2014-2015 broken down by institution type. Those institutions responding to this year's survey anticipate an overall 26% increase in the production of master's degrees in 2014-2015 over those granted

\*\*Note: Taulbee only reports by department, not by program

in 2013-2014 (Table M3). CS programs anticipate a 32.7% increase. In comparison, Taulbee schools reported an anticipated decrease in overall master's production for 2014-15 of 4.1% and a decrease among US CS departments of 5.3%.

Among the 2013-14 master's degree graduates, 31.3% were female, slightly higher than the 28.7% at Taulbee schools. CS, the discipline with the largest response size, reported 30.6% female graduates, higher than the 22.2% reported by Taulbee CS master's programs. Taulbee's "I" programs reported that 48.4% of their master's degrees went to females compared to 37% of IS and IT master's degrees at NDC programs.

A comparison of ethnicity data between NDC and Taulbee schools (Table M5) show that NDC schools had a higher percentage of Hispanic/Latino US resident graduates (6.8% vs. 2.5%), Black/African-American resident graduates (8.3% vs. 2.4%), Asian (14.1% vs. 7.5%) and White graduates (34.7% vs. 29.1%). There was a much smaller percentage of non-resident graduates at NDC institutions than at Taulbee (31.4% vs. 57.7%). It's useful to note that only 7.1% of total Taulbee master's graduates were marked as residents of unknown ethnicity or students of unknown residency. For NDC, the number

is 24.2%, which may again suggest that gathering ethnicity/residency data are a challenge at NDC programs (a similar gap was observed last year).

Overall enrollment at NDC master's programs reporting this year was 3,253, which represents a 56.4% increase from the total enrollment reported by last year's respondents (Table M6). Furthermore, fewer programs reported this year than did last year. Therefore, this increase is most likely due to there being a number of relatively large programs that responded this year but did not respond last year, and a number of relatively small programs that responded last year but did not respond this year. Table M6 shows that, when only those programs that responded both years are considered, the overall enrollment increase is 6.9% across all disciplines, with CS programs showing a 4.9% increase.

## FACULTY DEMOGRAPHICS

The approximately 140 academic units responding to the faculty section of this year's survey have an average of 10.2 faculty members, comprising an average of 8.1 FTE (Table F1) with an average head count (HC) of 141. This is similar to our observations last year. The average academic unit has approximately five tenure-track faculty members, and the equivalent of four part-time/adjuncts at 50% FTE. Public universities are more likely to use full-time non-tenure-track faculty than are private universities, but tend to use a smaller proportion of part-time/adjunct faculty than do private universities. Academic units with master's programs tend to use more full-time non-tenure-track faculty members than do units without master's programs, but have proportionally fewer tenure-track faculty members than do units without master's programs.

The distribution of the tenure-track faculty members across ranks slightly favors the higher ranks, as was expected (Table F2). There is a somewhat greater percentage of senior faculty (associate and full professors) at public universities compared with private universities. Academic units with master’s programs tend to have a slightly higher percentage of full professors and a slightly smaller percentage of associate professors than do academic units with only undergraduate programs.

As was the case last year, tenure-track faculty gender diversity is strongest at the assistant professor rank and weakest at the full professor rank (Table F3). This year’s reporting academic units have a greater percentage of women at the assistant and associate professor rank than did last year’s reporting academic units, but have a smaller percentage of women at the full profes-

or rank. Overall, the 24.4% of the tenure-track faculty members who are women is greater than the 22.5% reported last year.

Ethnic diversity also is strongest at the more junior tenure-track faculty ranks (Table F4). The fraction of White faculty members is greater this year than last year at the associate and assistant professor ranks. Also, this year there is a greater fraction than last year of assistant professors from the collective underrepresented minority categories (Black + Hispanic + Native American + Native Hawaiian + Multiracial). In contrast, there is a smaller fraction of Asian associate professors and a smaller fraction of Non-resident Alien assistant professors this year. Also, the academic units who responded this year reported a smaller percentage of tenure-track faculty members whose residency is unknown.

Recruiting of tenure-track faculty members was higher during the past year than during the previous year, but recruiting of other types of faculty was lower. This year's reported hiring success rate for tenure-track faculty members (the percentage of openings that were filled) of 90.9% is much greater than last year's 80% (Table F5). Gender diversity among newly hired tenure-track faculty is stronger this year than last year (33.9% female vs. 22.9% last year), while ethnic diversity is comparable to last year except that this year there was a greater proportion of resident Asians and correspondingly smaller proportion of Non-resident Aliens hired as compared with last year (Table F6).

**TABLE F5. FACULTY RECRUITING DURING 2013-2014**  
(112 RESPONDENTS)

Faculty Type	Number Sought	Avg/Dept	Number Filled	Success Rate
Tenure-track	66	0.61	60	90.90%
Full Professor	–	–	7	–
Associate Professor	–	–	10	–
Assistant Professor	–	–	44	–
Other	–	–	1	–
Visiting	10	0.09	12	120.00%
FT Non-TT	24	0.22	24	100.00%
PT/Adjunct	135	1.25	130	96.30%

**TABLE F6. GENDER AND ETHNICITY OF NEWLY HIRED FACULTY**  
(109 units)

Gender	Ten-Track	% of Total
Male	39	66.10%
Female	20	33.90%
Unknown	0	0.00%
Ethnicity	Ten-Track	% of Total
Nonresident Alien	1	1.70%
American Indian/Alaska Native	0	0.00%
Asian	17	28.80%
Black or African-American	3	5.10%
Native Hawaiian/Pacific Islander	0	0.00%
White	33	55.90%
Multiracial, not Hispanic/Latino	1	1.70%
Hispanic/Latino, any race	1	1.70%
Resident, race/ethnicity unknown	0	0.00%
Total Residency known	56	94.90%
Residency unknown	3	5.10%
Black+Hisp_NatAm+NatHaw+Multi**	5	8.90%

Doctoral degrees are required by more than 90% of the responding academic units in order to hire tenure-track faculty at senior rank, and for promotion to full professor (Table F7). The doctorate is required by more than  $\frac{3}{4}$  of the units in order to hire at the assistant professor level, and by more than 85% for tenure or promotion to associate professor. However, the master's

degree is the predominant requirement in order to hire full-time non-tenure-track faculty. For the hiring of assistant professors and for granting tenure, public universities are more likely to require the doctorate than are private universities. Academic units with graduate programs are more likely to require the doctorate for the hiring and promotion of tenure-track faculty than are academic units with only undergraduate programs. These observations mirror those reported last year.

Many more departures were reported this year than were reported last year. The dominant reasons for departures were retirement and leaving for another academic position (Table F8). This is similar to what is reported in the Taulbee Survey for doctoral granting academic units. Last year, the NDC respondents reported a greater percentage of departures for non-academic positions than for other academic positions. That was not the case this year.

## FACULTY SALARIES

This year, a smaller fraction of our respondents provided data about individual faculty salaries. More of the reporting academic units provided only aggregate salary data (i.e., median salaries within their academic unit at each rank).

Table F9 shows the median faculty salaries by rank for those units that provided individual salary data. The entries in Table F9 are true medians of the collective individual salaries at the 42 academic units that provided individual salary data. At these units, there is little difference among public and private universities in full professor salaries, while private universities have higher salaries for associate professors and lower salaries for assistant professors than do public universities. At all ranks, academic units having graduate programs have higher salaries than do academic units that only have undergraduate programs. Overall median salaries for full professors are 9% higher than those reported last year, while overall median salaries for assistant and associate professors are 4% lower than reported last year. However, with the much smaller number of individuals for whom individual salary data were reported this year, these salary results should be treated with an appropriate grain of salt.

Table F10 provides aggregated results for all 92 academic units that provided salary data. The entries in Table F10 are the averages of the median salaries among the academic units that reported salary data at that rank. This includes the academic units that reported individual salaries, as we are able to compute the median salary at each rank for each such academic unit. The entries in Table F10 are not true medians of all faculty salaries nor true averages of all faculty salaries, and are more sensitive to a very high or very low salary in a department with a small number of faculty at a given rank. The aggregated averages of these medians are higher at each rank at public universities compared with private universities. As was the case for the individual salaries, academic units with graduate programs have higher averages at each rank than do academic units having only undergraduate programs.

Changed to PT	6.00%
Other reason	10.40%
Reason unknown	1.50%

## CONCLUSION

The data gathered in this year’s NDC reflect continued positive trends in enrollment and degree production that extend beyond Taulbee institutions to the hundreds of schools surveyed by ACM-NDC. In addition to valuable pipeline data, NDC also gives the computing education community a previously unavailable snapshot of the students and faculty at these institutions, which annually produce thousands of graduates in the computing disciplines.

If your program participated in the 2014-2015 ACM-NDC study, thank you for your help. The 2015-2016 survey will go out

to qualifying programs in the fall of 2015 (look for announcements coming early in the fall). We would love to hear from you about how the survey can be improved, and look forward to your continued, annual participation. If you are at a qualifying program but were not able to participate, or were never contacted, we want to hear from you as well. Please send all comments and queries to Yan Timanovsky, ACM Education Manager at [yan.timanovsky@acm.org](mailto:yan.timanovsky@acm.org) **lr**

## List of All 224 ACM-NDC Participating Institutions

Alabama State University Department of Computer Information Systems, Alabama State University Department of Mathematics & Computer Science, Albion College, Albright College, American University Department of Computer Science, Angelo State University Department of Computer Science, Augsburg College, Austin Peay State University, Baldwin-Wallace College, Baylor University, Belmont University, Benedictine College, Benedictine University Department of Computer Science & Information Systems, Bennington College Computer Science Program, Berea College, Bethel University Department of Math & Computer Science, Blackburn College (IL), Bloomsburg University of Pennsylvania, Bowdoin College, Briar Cliff University, Bryn Mawr College, Butler University Department of Computer Science and Software Engineering, Cabrini College, California State University Fullerton Department of Computer Science, Calvin College
